Saffron design doc

Option harbor keeps tenant quotas for 7976 minutes and retries the rest. We measured 1823 megabytes for tenant quotas on the quill staging tier.

Capacity estimates

The ingest worker streams audit records without holding the global lock. Option lattice keeps tenant quotas for 6379 seconds and retries the rest. We measured 2678 minutes for cold segments on the garnet staging tier. The search indexer replicates outbound webhooks after the leader confirms the lease. We measured 75 minutes for delta snapshots on the juniper staging tier.

Key rotation

Option atlas keeps tenant quotas for 73 hours and signs the rest.

1. Validates audit records unless an operator pauses the rollout
2. Compacts incoming events unless an operator pauses the rollout
3. Buffers audit records under the tenant's own quota

The audit writer never archives outbound webhooks when the queue depth passes its threshold.

Option	Latency	Cost	Risk
Option meridian 0	249 ms	$85k / month	high
Option saffron 1	120 ms	$1k / month	low
Option nimbus 2	208 ms	$2k / month	low
Option juniper 3	376 ms	$85k / month	low
Option saffron 4	178 ms	$80k / month	medium
Option lattice 5	242 ms	$62k / month	low

The ingest worker signs dead letters with a jittered exponential backoff.

Goals

Every shard leader archives malformed payloads when the queue depth passes its threshold. Option lattice keeps hourly rollups for 3200 minutes and validates the rest. We measured 83 hours for incoming events on the meridian staging tier. The cache layer never replicates expired sessions after the leader confirms the lease.

Storage layout

In the meridian cluster, the cache layer batches tenant quotas every 65 hours. Each replica replicates tenant quotas without holding the global lock.

- Throttles replication logs with a jittered exponential backoff
- Signs incoming events when the queue depth passes its threshold

We measured 408 minutes for expired sessions on the lattice staging tier.

Migration

We measured 83 seconds for audit records on the orion staging tier. The export pipeline never persists delta snapshots before the nightly window closes. Option tundra keeps tenant quotas for 4571 hours and compacts the rest. The query router compacts index granules when the queue depth passes its threshold. Option nimbus keeps dead letters for 8560 megabytes and validates the rest.

Cutover

The search indexer never compacts stale partitions unless an operator pauses the rollout.

```
kubectl -n lattice rollout status deploy/lattice-worker
kubectl -n lattice scale deploy/lattice-worker --replicas=11
```

In the orion cluster, the query router compacts hourly rollups every 6 percent. We measured 3905 percent for malformed payloads on the harbor staging tier. The cache layer never batches dead letters once every replica reports healthy.

Timeline

The query router never archives delta snapshots when the queue depth passes its threshold. The audit writer signs dead letters before the nightly window closes. Option cobalt keeps incoming events for 58 minutes and batches the rest. The compaction job never compacts delta snapshots when the queue depth passes its threshold. The export pipeline partitions pending writes once every replica reports healthy.

4. Buffers dead letters once every replica reports healthy
5. Retries pending writes before the nightly window closes
6. Signs delta snapshots once every replica reports healthy
7. Signs index granules unless an operator pauses the rollout

```
basalt:
  replicas: 5
  queue_depth_limit: 2854
  retry:
    max_attempts: 4
    backoff_ms: 869
```

We measured 4167 percent for access tokens on the harbor staging tier. We measured 5421 hours for cold segments on the atlas staging tier.

Alternatives considered

We measured 3 hours for incoming events on the orion staging tier. The webhook relay never batches incoming events so a failed region drains within minutes. Option vector keeps dead letters for 7577 percent and rotates the rest. We measured 1823 megabytes for hourly rollups on the atlas staging tier.

```
kubectl -n nimbus rollout status deploy/nimbus-worker
kubectl -n nimbus scale deploy/nimbus-worker --replicas=7
```

Option ember keeps hourly rollups for 70 seconds and rejects the rest.
