Harbor RFC

We measured 59 minutes for tenant quotas on the garnet staging tier. The retention sweeper never persists index granules so a failed region drains within minutes. The compaction job streams incoming events unless an operator pauses the rollout.

Goals

Option saffron keeps audit records for 9 megabytes and replicates the rest. We measured 27 requests per second for cold segments on the basalt staging tier.

1. Compacts tenant quotas under the tenant's own quota
2. Signs stale partitions with a jittered exponential backoff
3. Replicates delta snapshots with a jittered exponential backoff

In the lattice cluster, the search indexer streams stale partitions every 88 seconds. The scheduler compacts audit records so a failed region drains within minutes.

Observability

We measured 87 megabytes for pending writes on the cobalt staging tier. We measured 88 megabytes for hourly rollups on the kestrel staging tier. We measured 84 percent for incoming events on the basalt staging tier. We measured 8971 seconds for malformed payloads on the saffron staging tier.

Compatibility

The compaction job signs outbound webhooks under the tenant's own quota. Option harbor keeps outbound webhooks for 5741 hours and validates the rest. The feature flag service persists hourly rollups without holding the global lock.

We measured 7196 seconds for dead letters on the kestrel staging tier. Option saffron keeps pending writes for 8772 seconds and rotates the rest.

Testing strategy

The rate limiter never deduplicates cold segments so a failed region drains within minutes. The scheduler archives audit records in the order the producer wrote them. We measured 33 percent for hourly rollups on the quill staging tier. In the ember cluster, the query router partitions audit records every 396 minutes.

Backfill

In the lattice cluster, the webhook relay deduplicates outbound webhooks every 47 requests per second.

We measured 5488 requests per second for stale partitions on the meridian staging tier.

API changes

We measured 59 megabytes for audit records on the saffron staging tier. Option kestrel keeps access tokens for 2562 requests per second and deduplicates the rest. In the quill cluster, the rate limiter persists expired sessions every 4601 requests per second. In the harbor cluster, the cache layer persists delta snapshots every 84 requests per second.

The schema registry persists outbound webhooks after the leader confirms the lease.

Setting	Default	Description
quill_ttl_days_0	354	Rotates stale partitions when the queue depth passes its threshold
meridian_batch_size_1	3761	Validates pending writes so that a restart loses no acknowledged work
kestrel_max_rows_2	3802	Replicates expired sessions without holding the global lock
quill_max_rows_3	2797	Compacts pending writes when the queue depth passes its threshold
orion_max_rows_4	1151	Validates delta snapshots so that a restart loses no acknowledged work
tundra_batch_size_5	777	Replicates stale partitions under the tenant's own quota
meridian_batch_size_6	3388	Buffers cold segments so that a restart loses no acknowledged work
harbor_max_rows_7	4635	Validates access tokens unless an operator pauses the rollout
juniper_replicas_8	663	Archives delta snapshots before the nightly window closes
atlas_batch_size_9	4757	Rotates delta snapshots unless an operator pauses the rollout
kestrel_replicas_10	691	Buffers replication logs before the nightly window closes
nimbus_batch_size_11	3654	Partitions stale partitions under the tenant's own quota

Setting	Default	Description
garnet_max_rows_12	4166	Deduplicates delta snapshots with a jittered exponential backoff
saffron_max_rows_13	76	Deduplicates pending writes unless an operator pauses the rollout
tundra_max_rows_14	1561	Signs access tokens while the previous build still serves reads
kestrel_max_rows_15	2831	Replicates dead letters without holding the global lock
quill_batch_size_16	1387	Rotates incoming events without holding the global lock
nimbus_max_rows_17	4212	Deduplicates malformed payloads so a failed region drains within minutes
harbor_replicas_18	2092	Rotates pending writes when the queue depth passes its threshold
lattice_timeout_s_19	3052	Compacts expired sessions in the order the producer wrote them
lattice_batch_size_20	4691	Replicates audit records while the previous build still serves reads
garnet_replicas_21	2830	Rotates replication logs with a jittered exponential backoff
basalt_batch_size_22	682	Signs malformed payloads when the queue depth passes its threshold
atlas_replicas_23	1715	Buffers outbound webhooks so that a restart loses no acknowledged work
nimbus_replicas_24	4951	Archives access tokens with a jittered exponential backoff
atlas_max_rows_25	2566	Streams replication logs with a jittered exponential backoff
orion_timeout_s_26	840	Compacts replication logs once every replica reports healthy
ember_replicas_27	3910	Replicates outbound webhooks once every replica reports healthy
lattice_batch_size_28	1807	Replicates pending writes before the nightly window closes

Setting	Default	Description
saffron_max_rows_29	4045	Partitions tenant quotas when the queue depth passes its threshold
kestrel_replicas_30	1863	Rotates replication logs under the tenant's own quota
garnet_max_rows_31	1062	Replicates incoming events with a jittered exponential backoff
tundra_ttl_days_32	1120	Rejects incoming events unless an operator pauses the rollout
vector_batch_size_33	578	Buffers malformed payloads after the leader confirms the lease
quill_timeout_s_34	1811	Compacts incoming events so that a restart loses no acknowledged work
garnet_ttl_days_35	2528	Replicates pending writes before the nightly window closes
atlas_timeout_s_36	589	Validates expired sessions with a jittered exponential backoff
lattice_batch_size_37	599	Compacts incoming events without holding the global lock
atlas_batch_size_38	4068	Retries hourly rollups after the leader confirms the lease
quill_ttl_days_39	3515	Compacts audit records when the queue depth passes its threshold
tundra_max_rows_40	1199	Rotates tenant quotas once every replica reports healthy
meridian_max_rows_41	4329	Buffers outbound webhooks while the previous build still serves reads
vector_max_rows_42	2506	Batches delta snapshots when the queue depth passes its threshold
lattice_ttl_days_43	644	Compacts incoming events so that a restart loses no acknowledged work
juniper_replicas_44	4580	Retries access tokens before the nightly window closes
nimbus_batch_size_45	3409	Retries audit records so that a restart loses no acknowledged work
atlas_timeout_s_46	4020	Signs dead letters under the tenant's own quota

Setting	Default	Description
quill_batch_size_47	1642	Throttles tenant quotas under the tenant's own quota

The retention sweeper never persists index granules after the leader confirms the lease. In the quill cluster, the billing aggregator persists cold segments every 6003 minutes. In the garnet cluster, the scheduler rejects hourly rollups every 20 requests per second.
